Help: Wiki Page Names

Wiki Page Names

Wiki page names commonly use the [CamelCase](#) convention. Within wiki text, any word in [CamelCase](#) automatically becomes a hyperlink to the wiki page with that name.

[CamelCase](#) page names must follow these rules:

1. The name must consist of **alphabetic characters only**. No digits, spaces, punctuation, or underscores are allowed.
2. A name must have at least two capital letters.
3. The first character must be capitalized.
4. Every capital letter must be followed by one or more lower-case letters.
5. The use of slash (/) is permitted in page names (possibly representing a hierarchy).

If you want to create a wiki page that doesn't follow [CamelCase](#) rules you can use the following syntax:

```
 * [wiki:Wiki_page], [wiki:ISO9000]
 * [wiki:"Space Matters"] that page name embeds space characters
 * or simply: ["WikiPageName"]s (!MoinMoin's internal free links style
)
```

This will be rendered as:

- [Wiki_page](#), [ISO9000](#)
- [Space Matters](#) that page name embeds space characters
- or simply ["WikiPageName"](#) (MoinMoin's internal free links style)

Finally, one can also append an anchor to a Wiki page name, in order to link to a specific section within that page.
