# The MGI and the Materials Data Infrastructure

James A. Warren Director, Materials Genome Program National Institute of Standards and Technology Executive Secretary, NSTC Subcommittee on the MGI

# **Define MGI and NIST Role Status of the Infrastructure (ready to go but not even close to done)** National Materials Data Network Meeting the Needs (Human Factors) Preview of MGI 2.0 □ Al as a Driver and transformations in materials R&D

## Scope

# Population

# The Materials Genome Initiative

**A Multi-Agency Effort** 

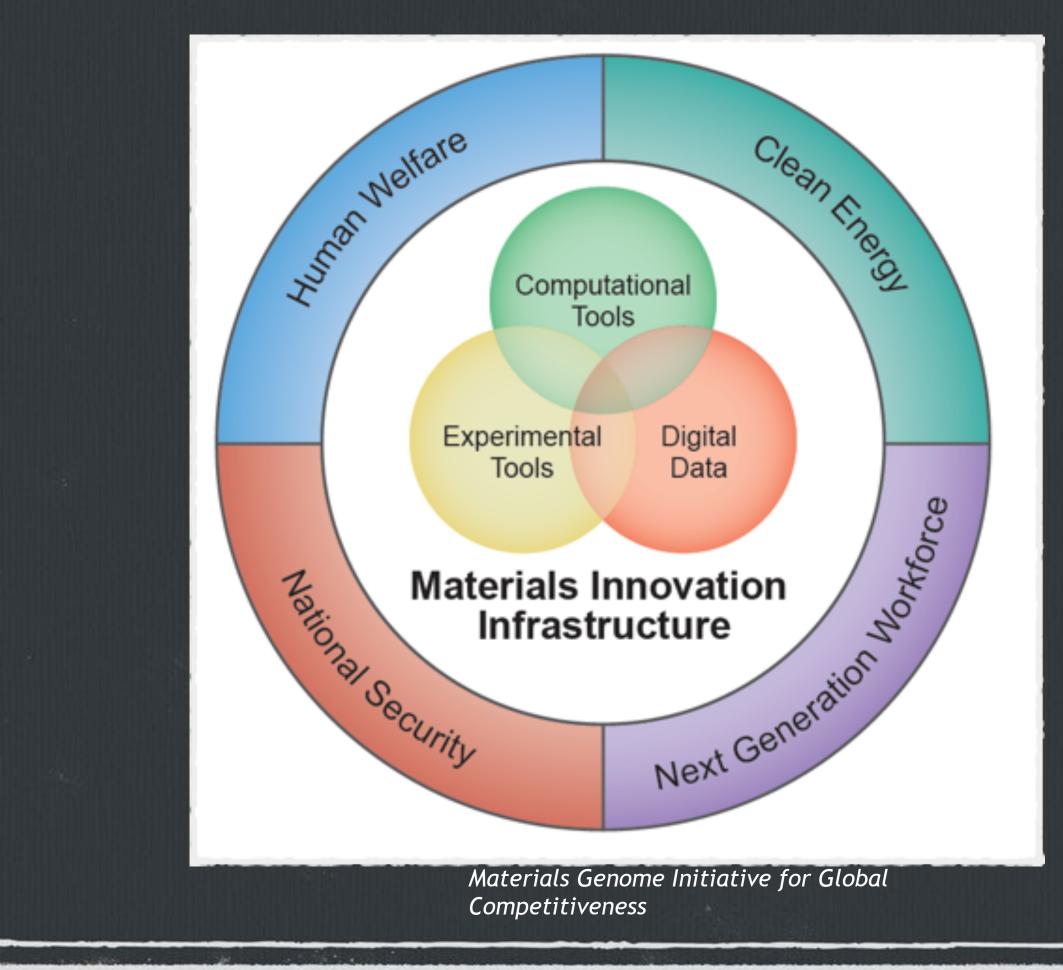

# It's an Initiative

DOE, NSF, NIST, DOD, NASA, FDA, NIH...

**3 years into a new adminstration** 

# To decrease time-to-market by 50% while

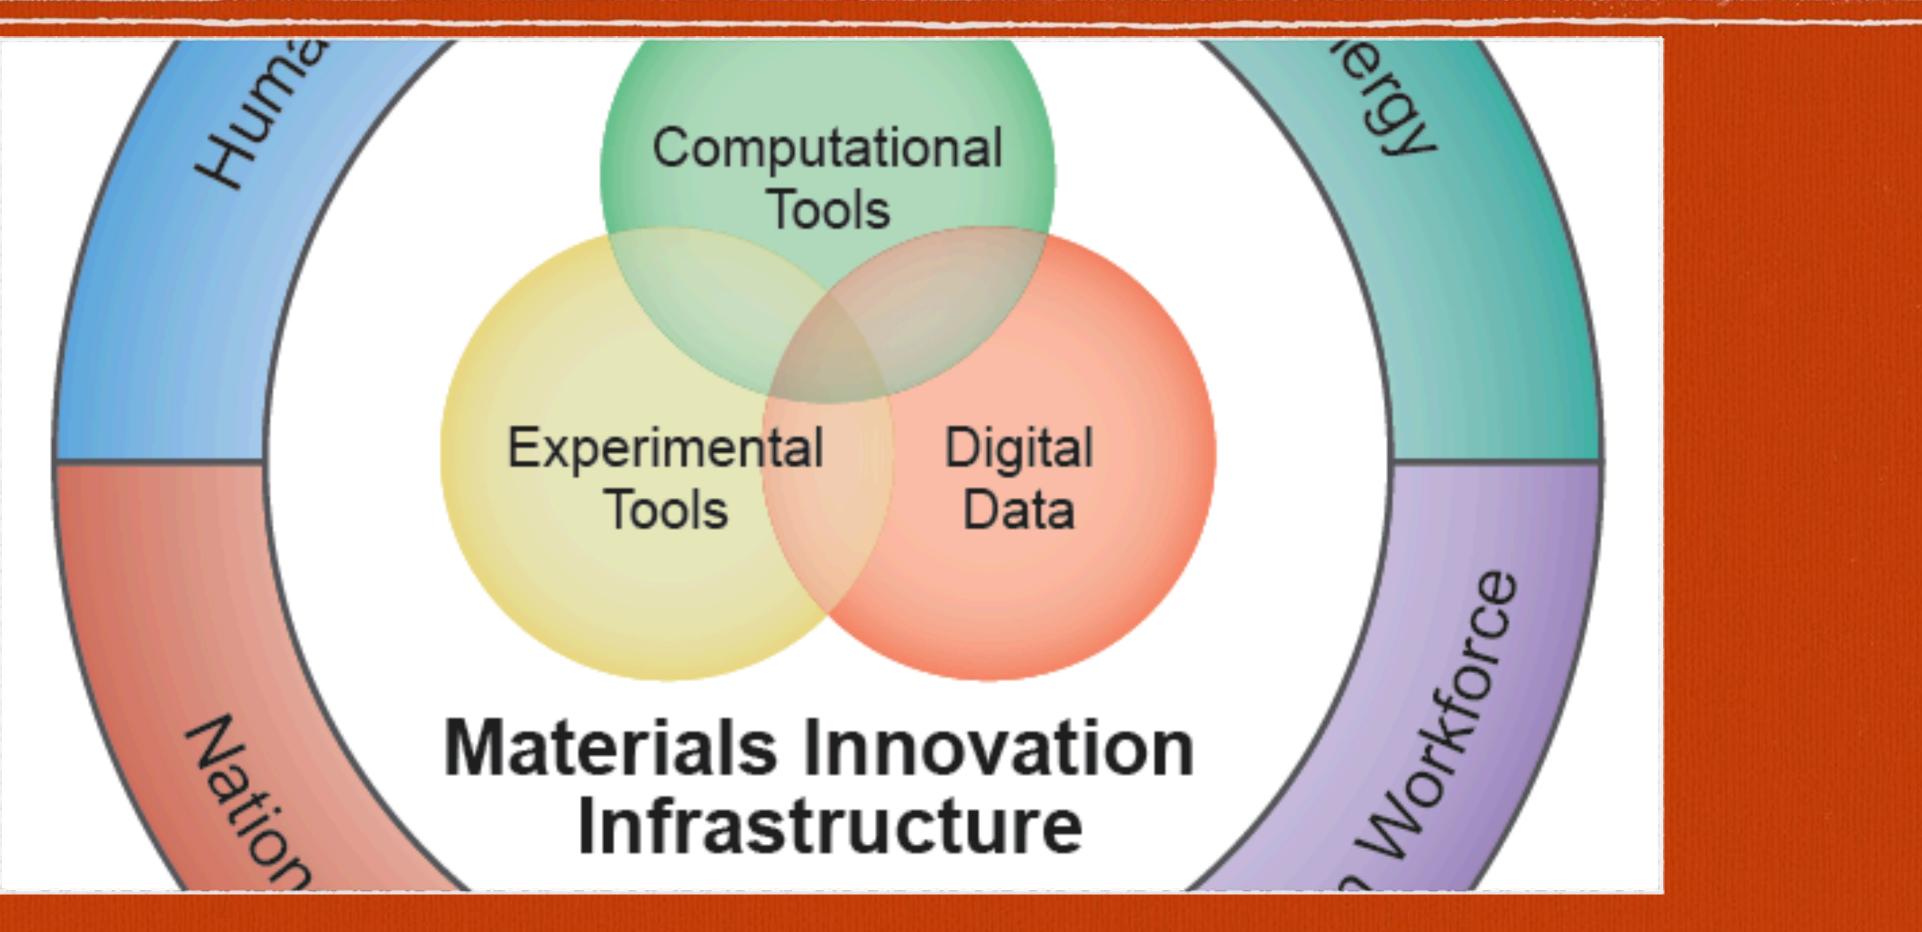

**Develop a Materials Innovation Infrastructure** 

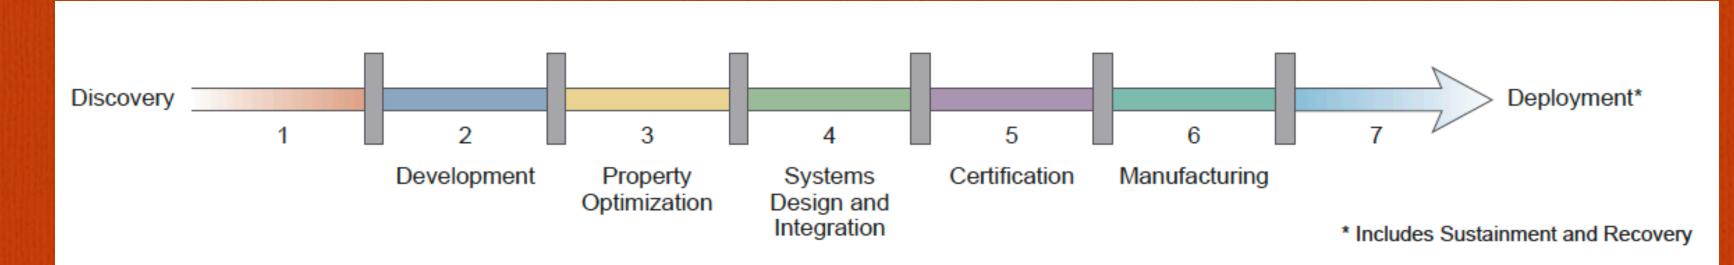

☐ Achieve National goals in energy, security, and human welfare with advanced materials

Equip the next generation materials workforce

#### **Span the Continuum**

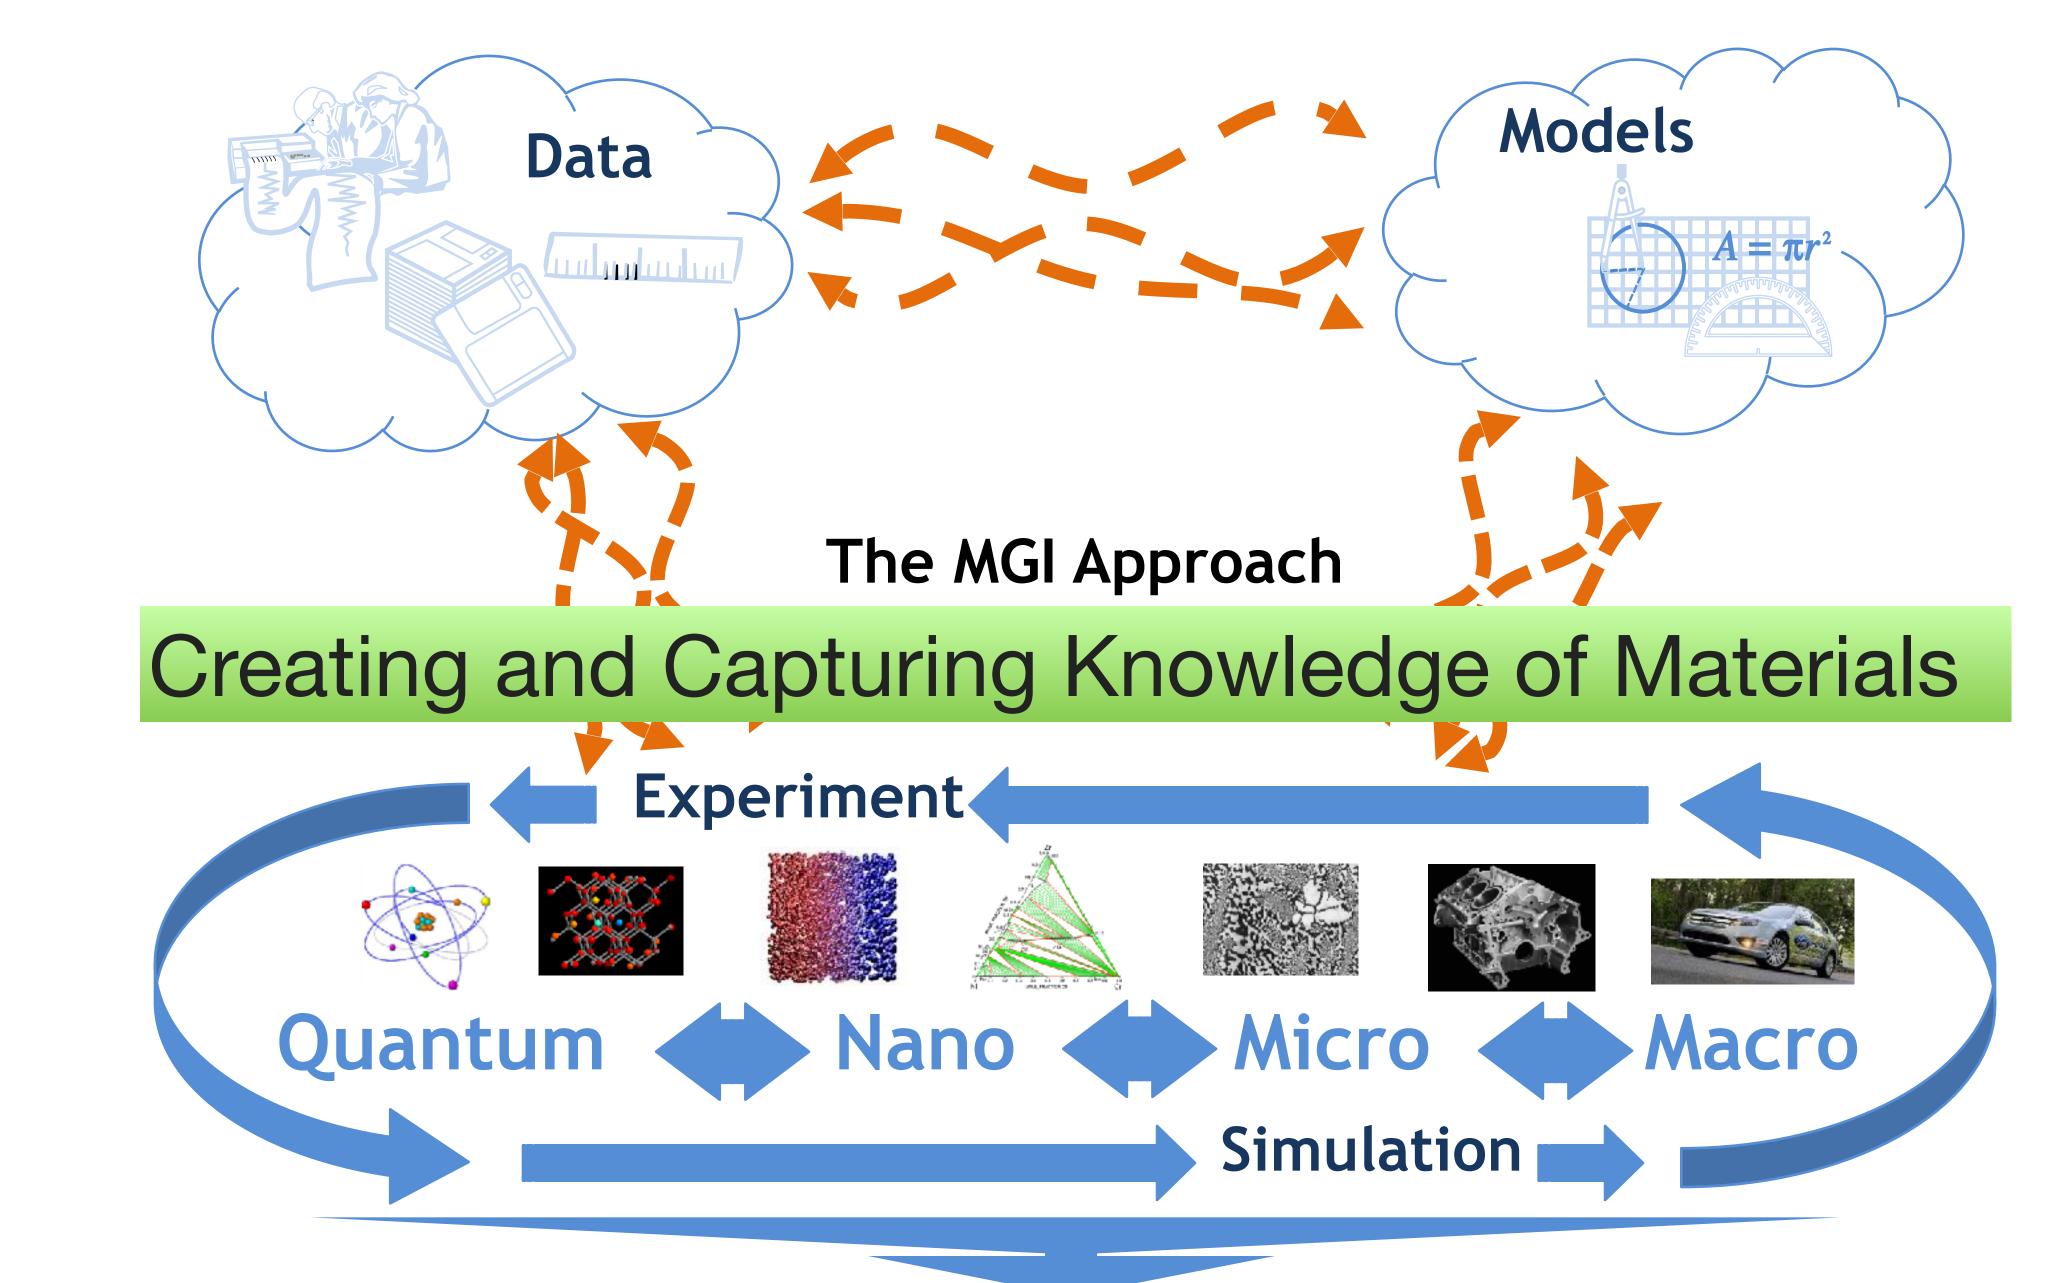

# The G in MGI

Metaphors

w/ Targeted Properties

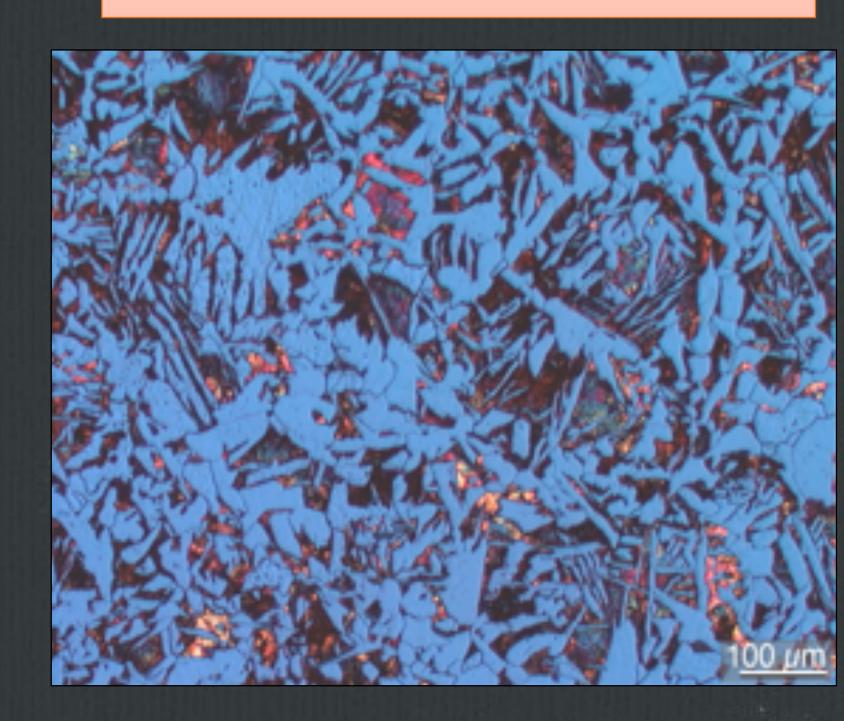

# Min MGI

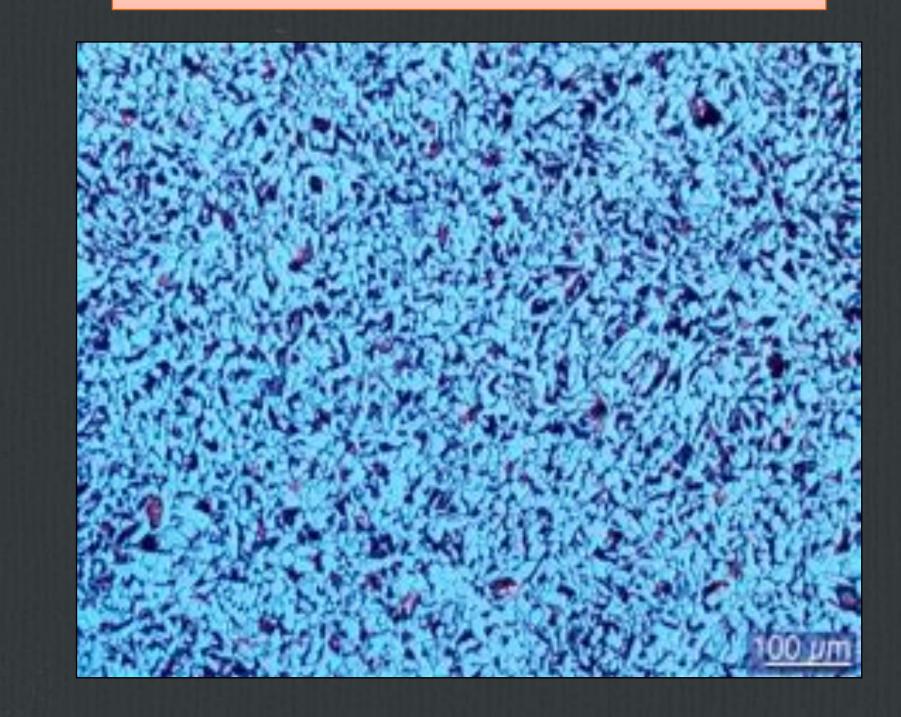

## Materials Are Complicated Systems Modeling is a Challenge

# Alloy cooled from 300 °C

### Alloy cooled from 800 °C

# The Decade of MGI?

These ideas are not new

#### Baseline: 316L Stainless Steel

#### -Cold-forged to 40% harder -Special purity mirror finish Milanese Loop Alloy

-Custom Magnetic Stainless Steel

## Apple watch -Announced September 2014

High Strength 18K Gold

#### -2X harder

#### Anodizable 7000 Aluminum

-60% stronger Al -30% lighter than 316L

- The MGI is about improving our ability to design and deploy new materials (faster) •Need better (or just any) data and models
- The MGI is essentially a direct consequence of our improvements in computational power and associated models, coupled to the disruptive consequences of the Internet.
- There are a limited number of ways to get the "knowledge" that is the fuel for the MGI
  - High Throughput Computations, w/ published data and software
  - High Throughput Experiments
  - published!)—- Change Publication and feed the models

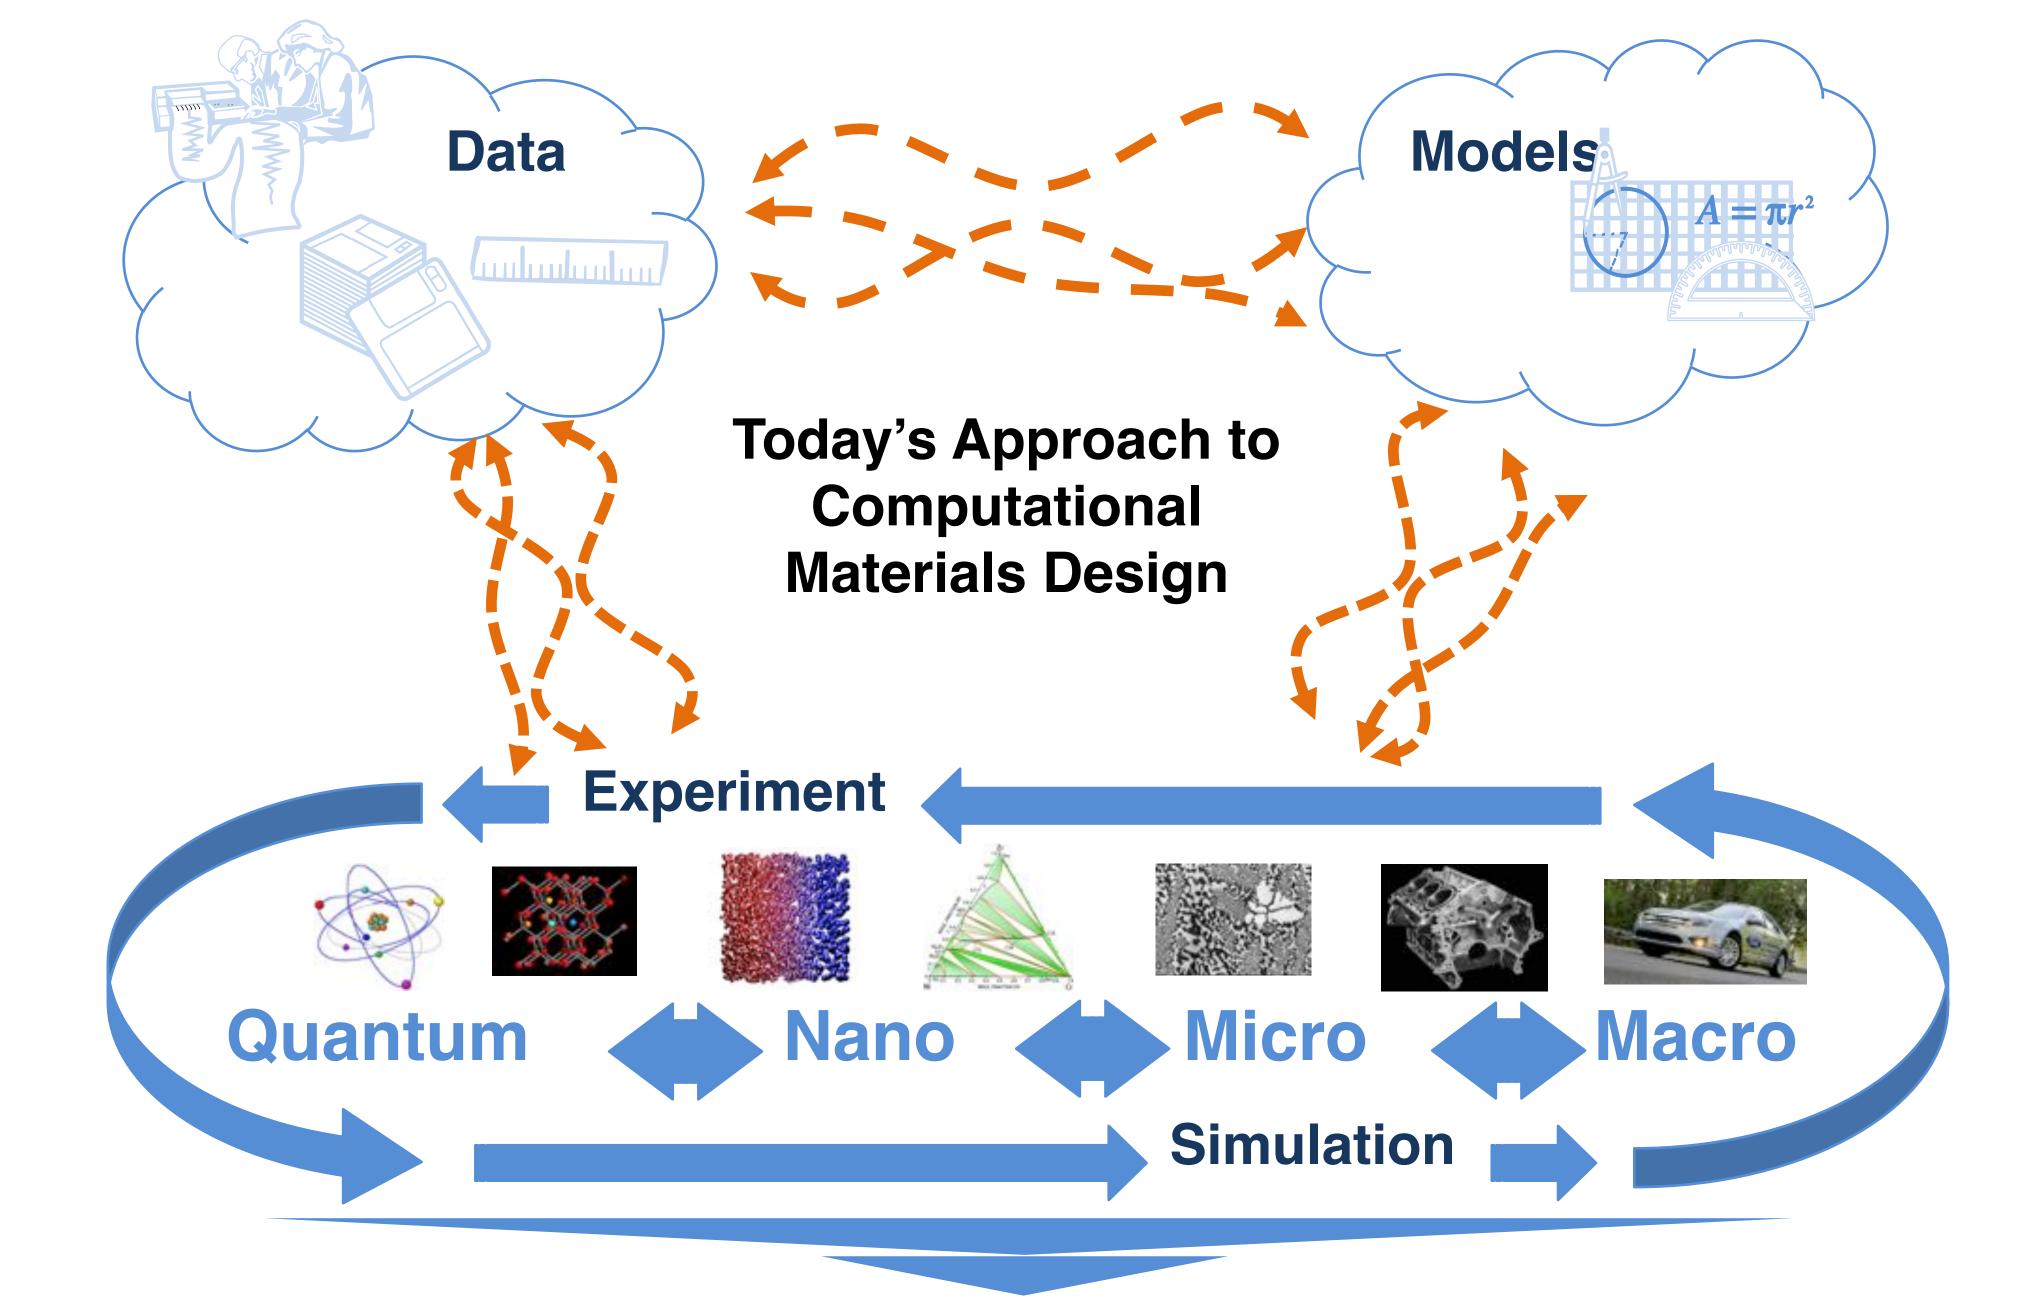

# NGIIN SUM

• Get it from everywhere (Mine the literature, mine published data, if only it were

# NIST Role ~2013

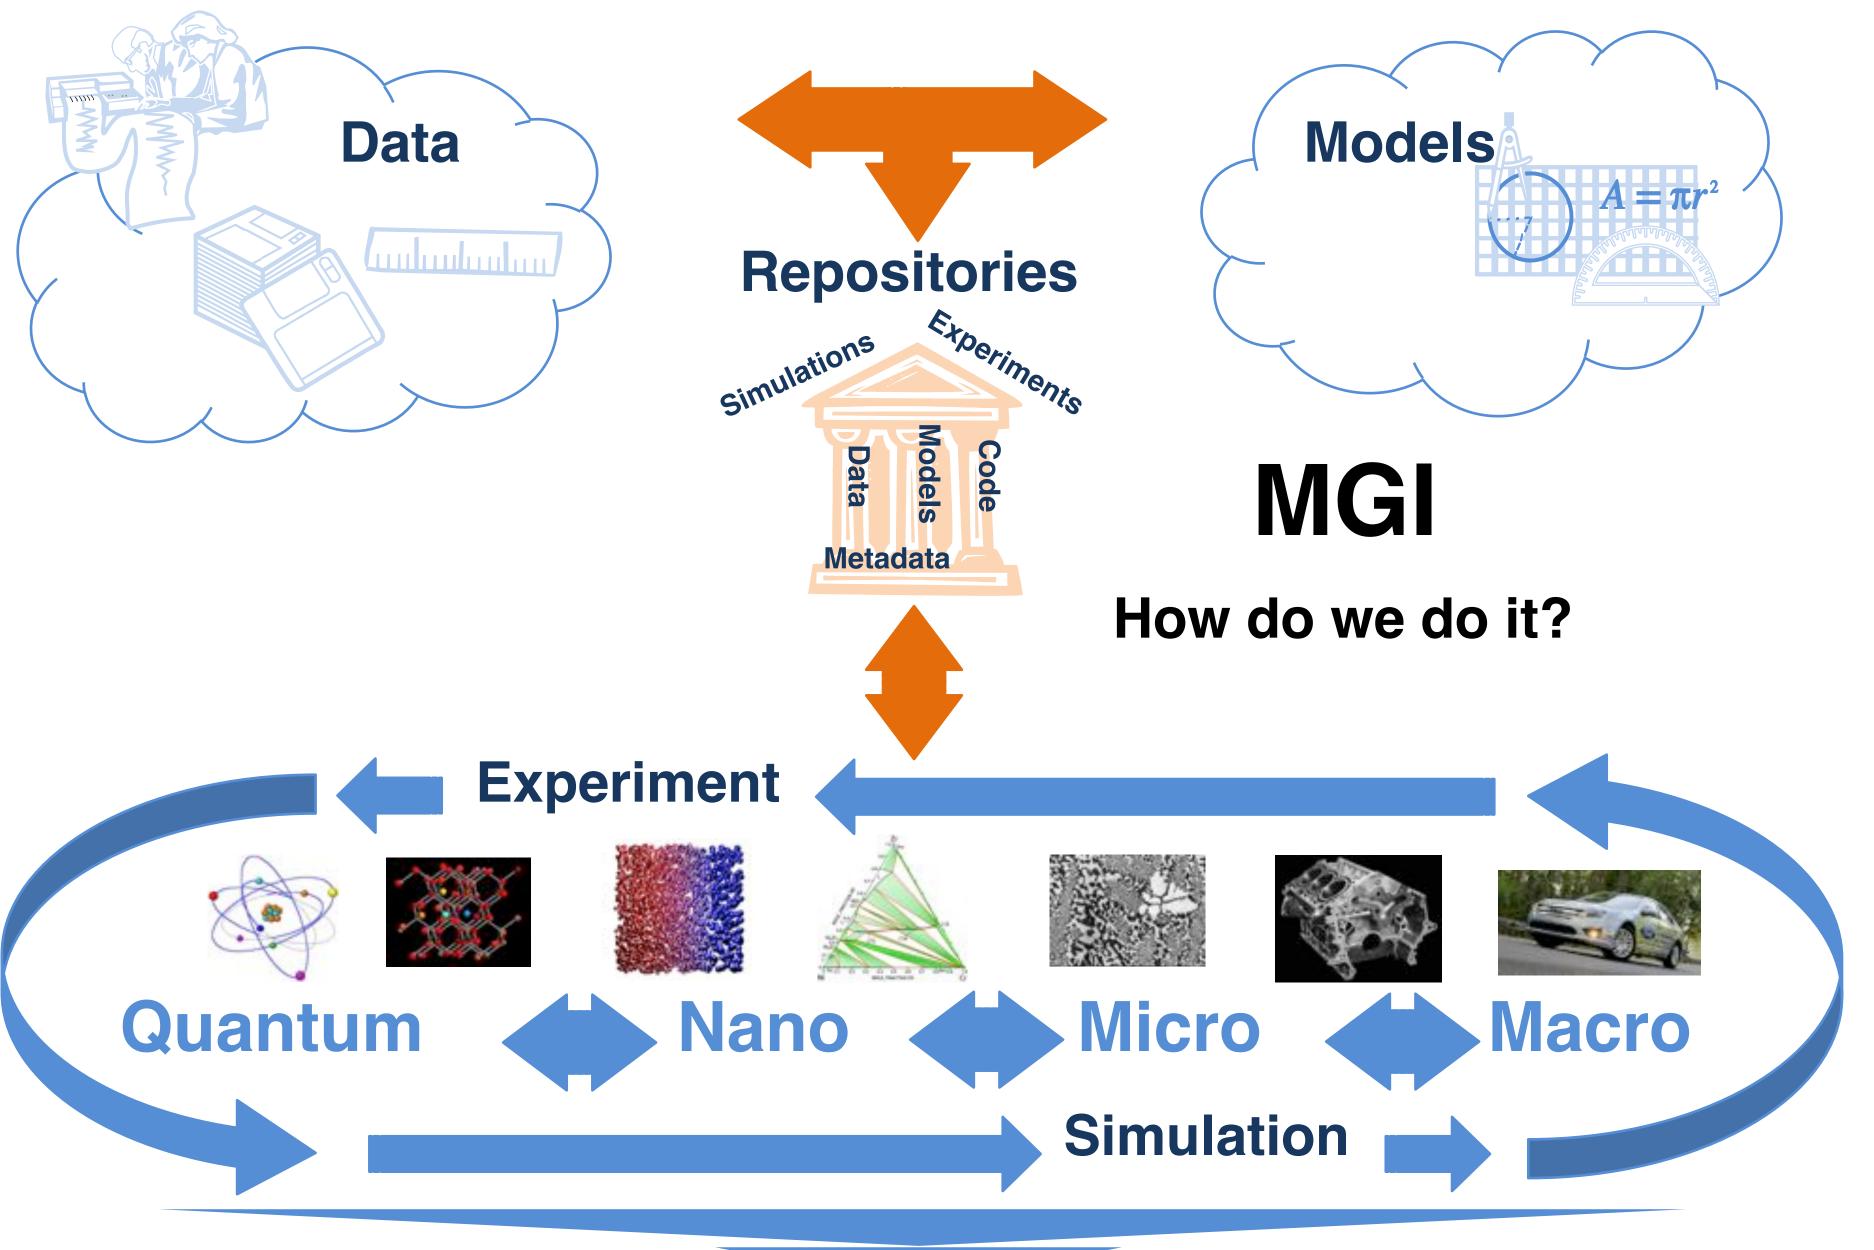

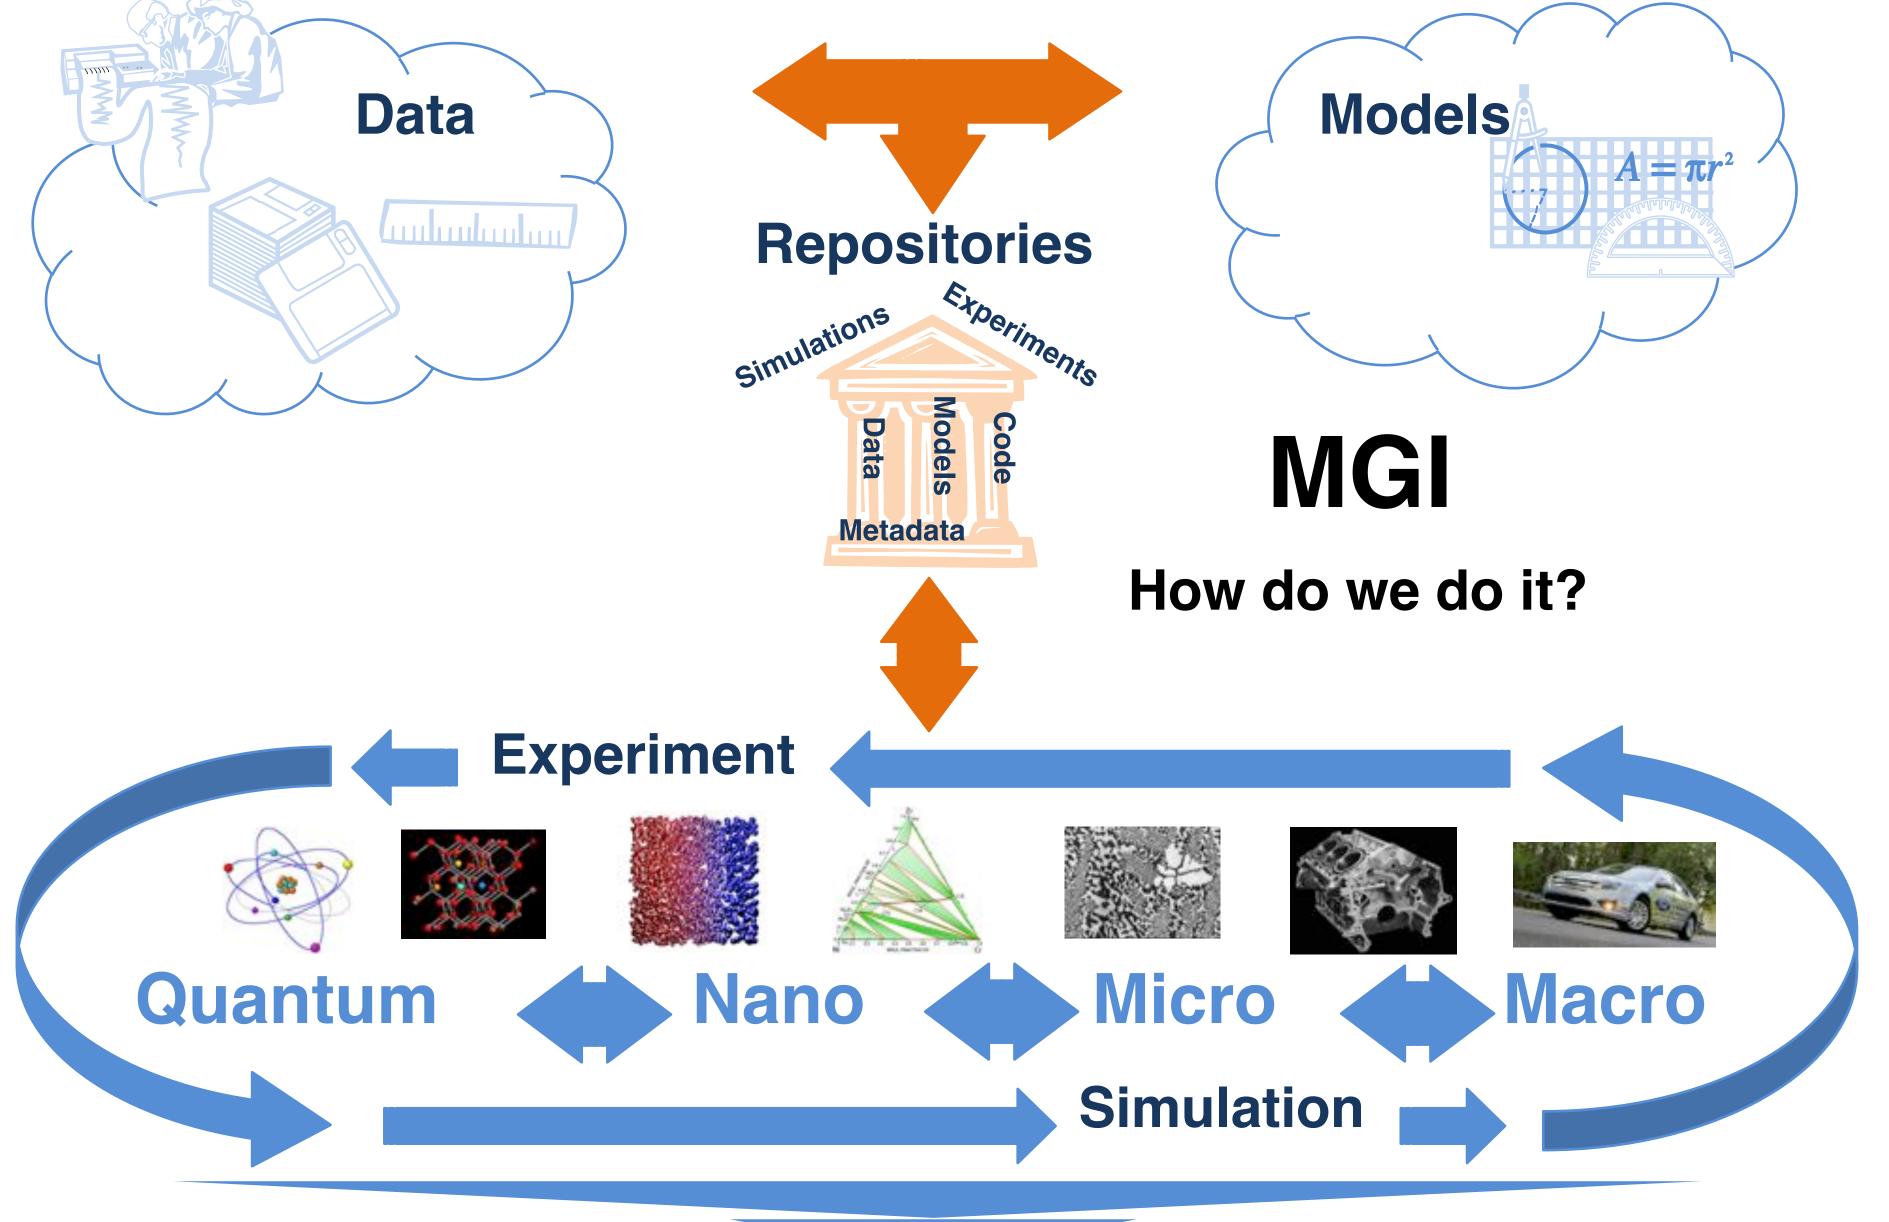

w/ Targeted Properties

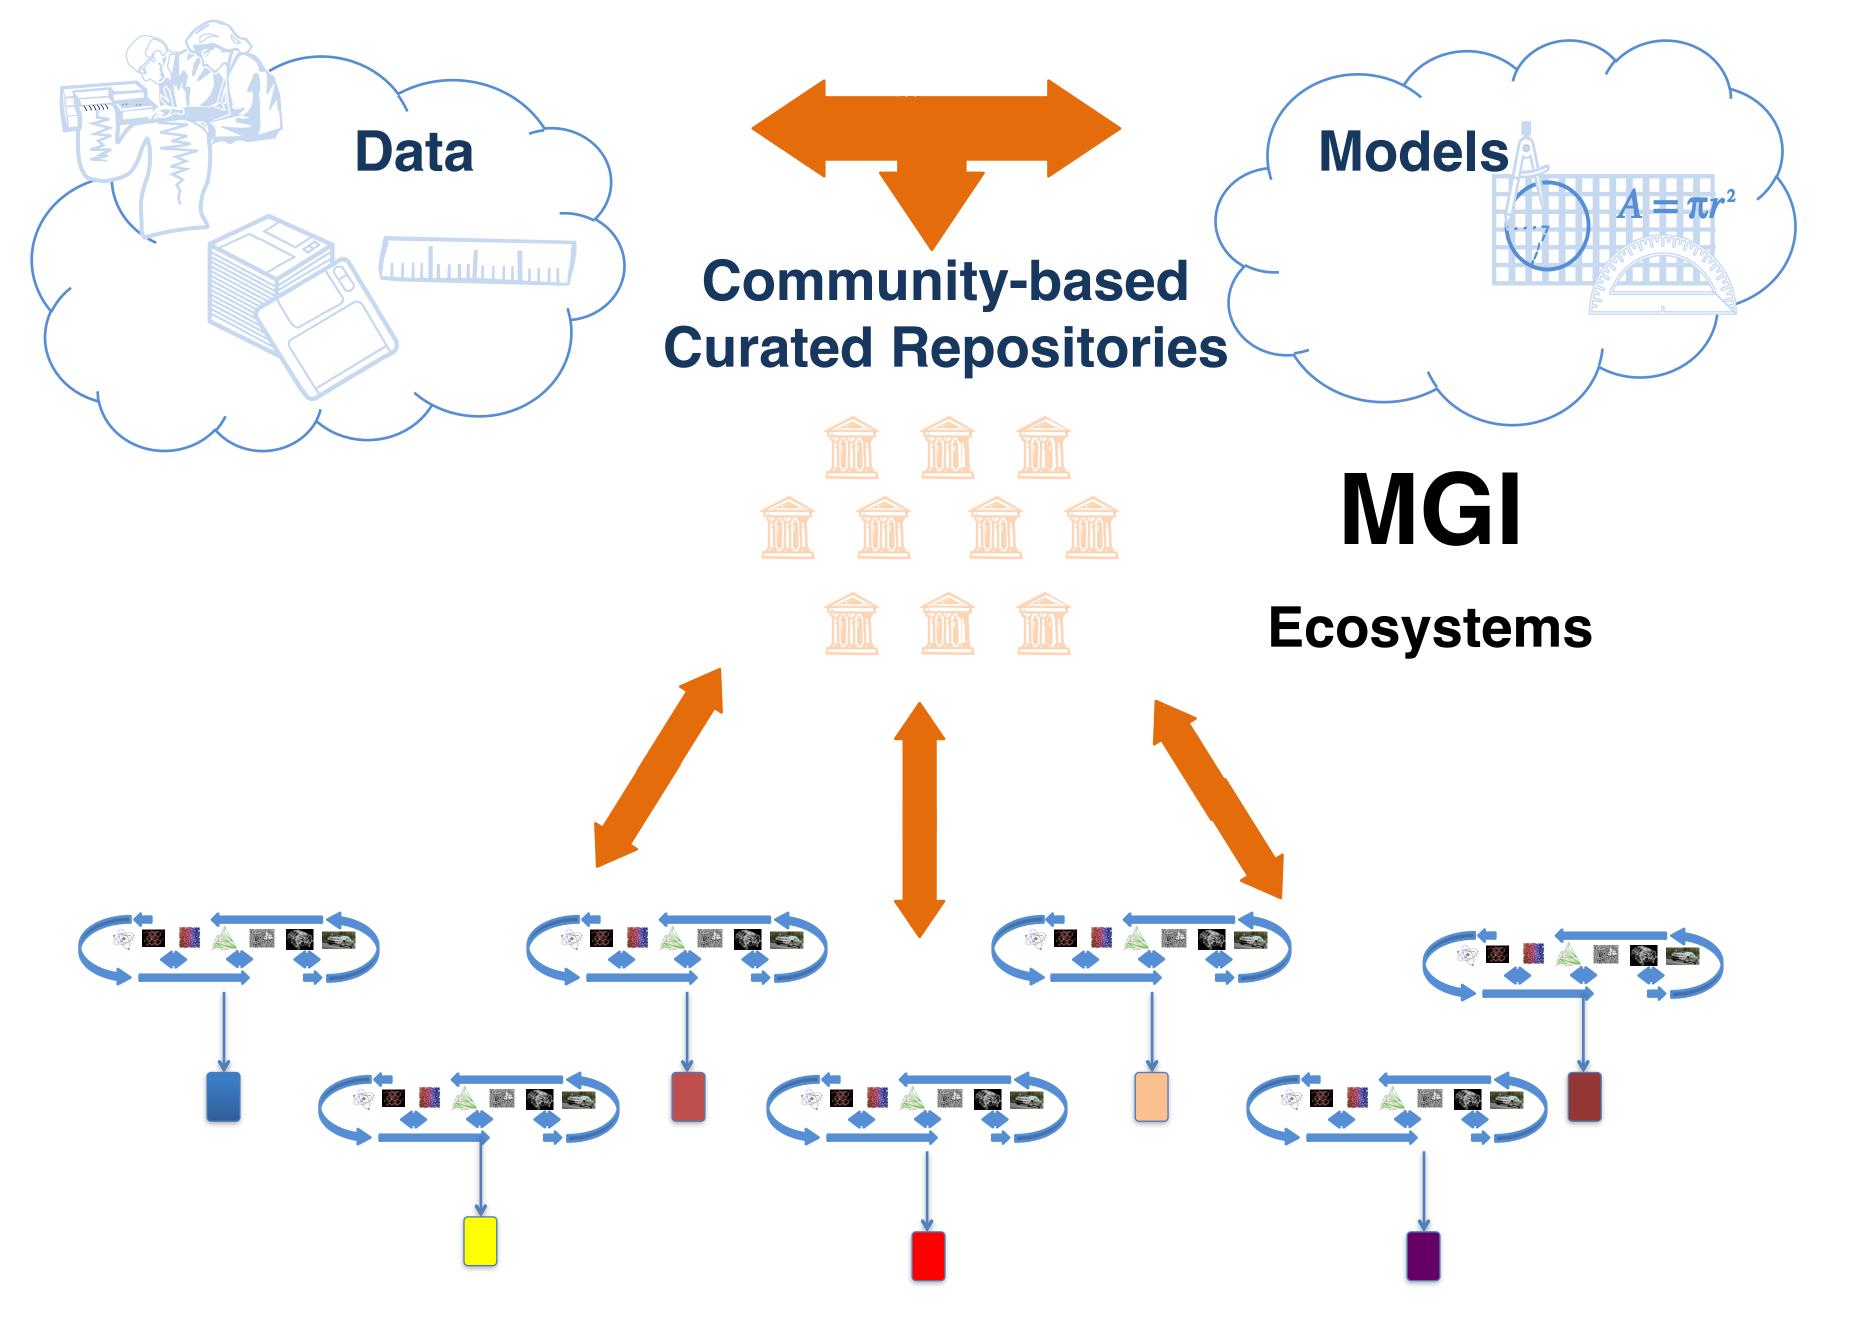

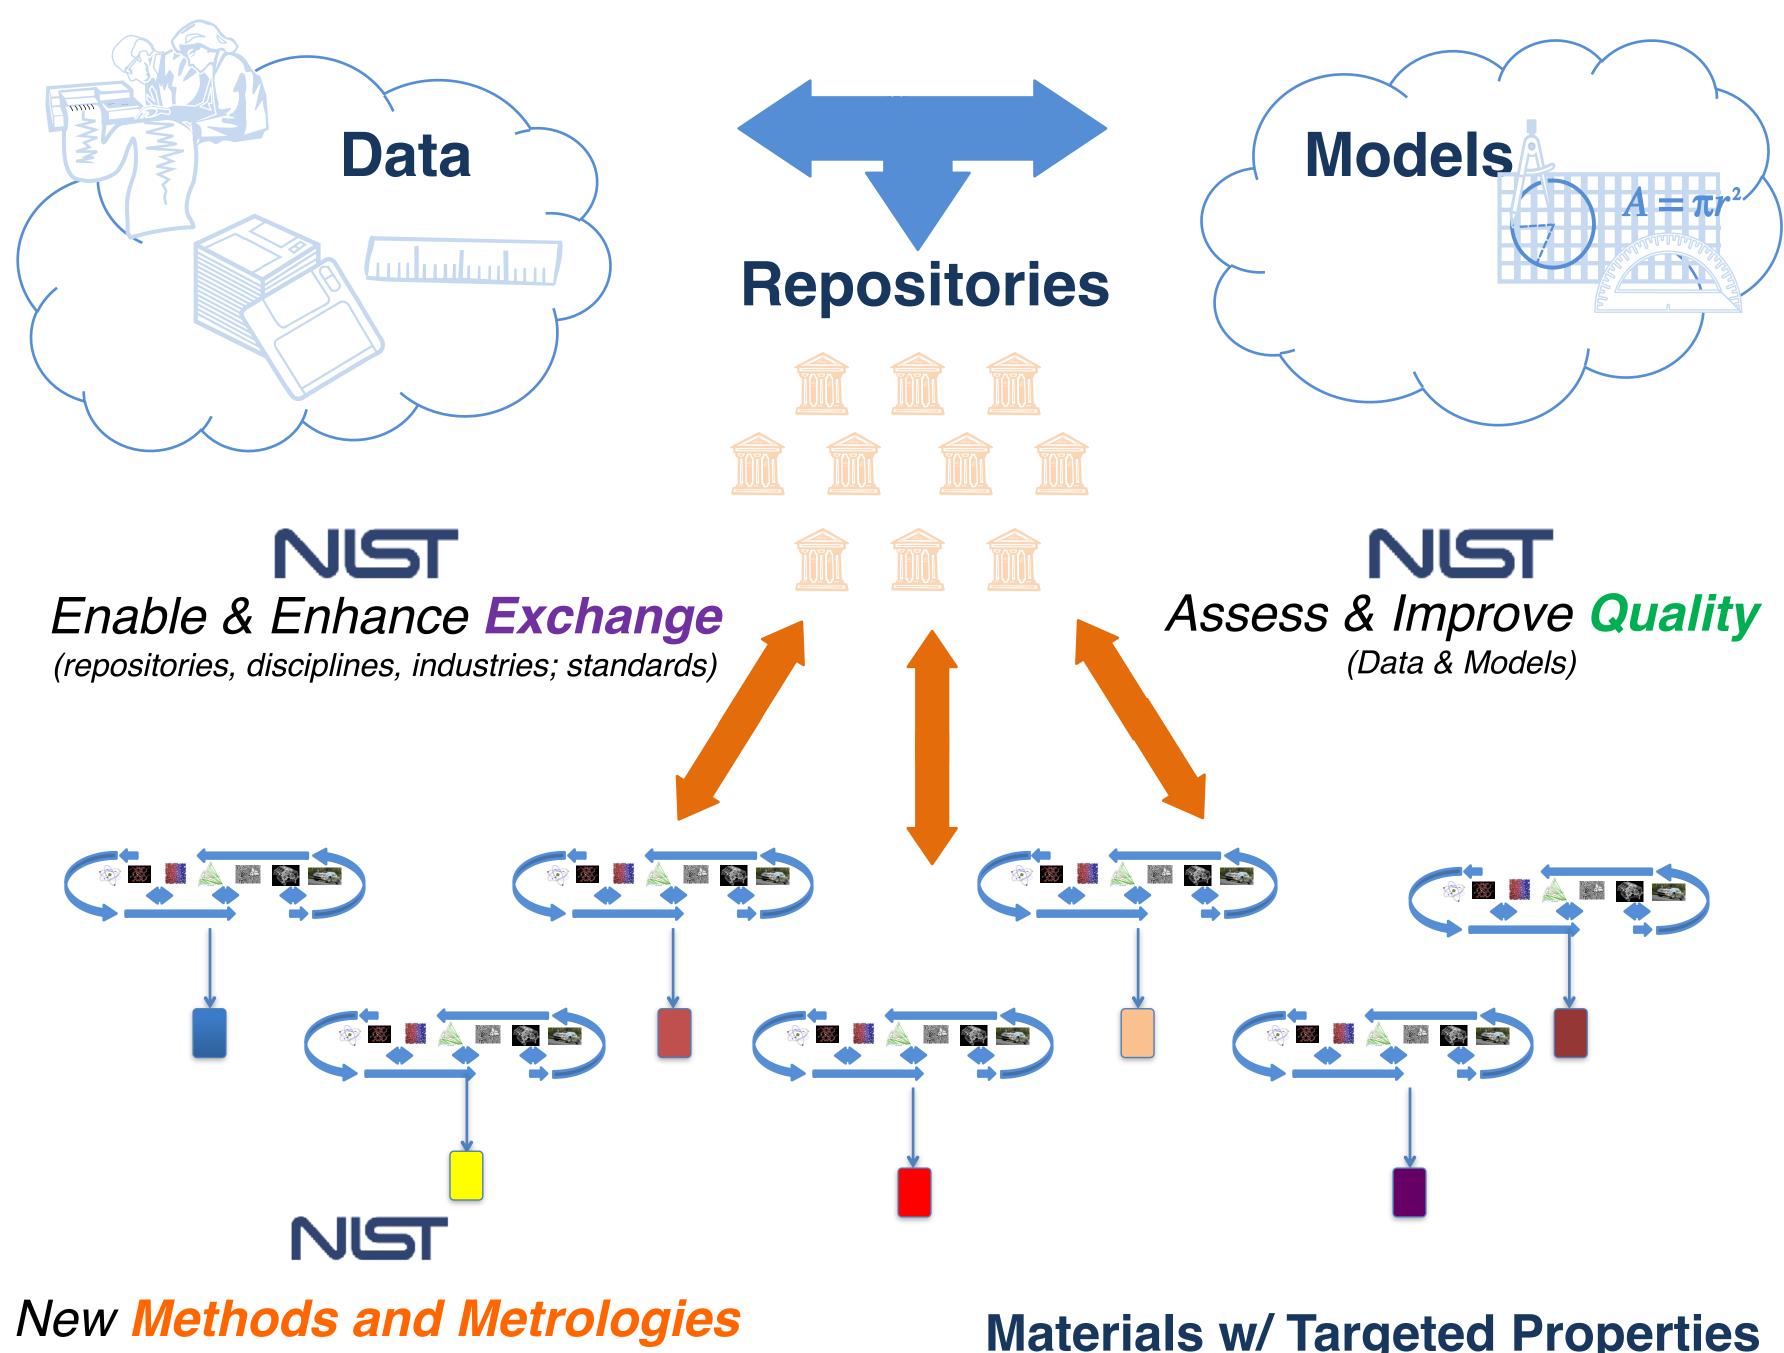

w/ Targeted Properties

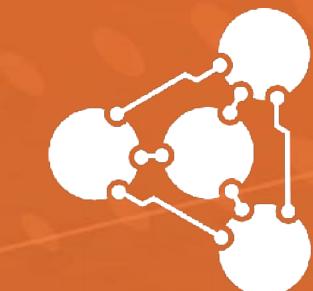

**Materials w/ Targeted Properties**

Materials Data Curation System         DESCRIPTION:         The NIST Materials Data Curation System (MDCS) provides a means for capturing, sharing, and transforming materials data into a structured format that is XML based amenable to transformation to other formats. The data are organized using user selected templates encoded in XML Schema. These templates encoded in XML Schema. These templates are used to create data entry forms. The documents are saved in a non-relational (NoSQL) database, namely MongoDB. The data can be searched and retrieved via several means: by a template deferrence of rederated searches.         MADR ACTIVITES         We have had six releases since first public release in 2015. These releases included an XML Schema composer to allow for rapid development of XML schemas for reusable types, a new UI module system that allows for fully featured applets to bassociater with XML tags, implementation of new administrative features such tools to perform repository back up and features. Later versions added the ability to compose XML schemas for reusable types and the ability to store images and other Binary Large Objects (BLOB). The most recent releases with template-based refinements, enhanced user and group permissions and access control, a user dashoard, OAI-PMH data harvester and provider functionality, template annotations, improved HTML template based with template-based refinements, enhanced user and group permissions and access the entire database with template-based refinements, enhanced user and group permissions and access control, a user dashoard, OAI-PMH data harvester and provider functionality, template annotations, improved HTML template based into an throstory into the processing of Call store of TML format the sense included isporters to transform curated data into other formats using XSLT or Python, full perform repository and a number of enh	OME PROJECTS ABOUT MATERIAL RESOURCE CENTERS FEDERAL MATERIALS GENOME INITIATIVE	ONLINE TOOLS CONTACT
DESCRIPTION:       LEAD ORGANIZATION UNIT:         The NIST Materials Data Curation System (MDCS) provides a means for capturing, sharing, and transforming materials data to a structured format that is XML based amenable to transformation to other formats. The data are organized using user- leacted templates encoded in XML. Schema. These templates are used to create data entry forms. The documents are organized using user- saved in a non-relational (NoSQL) database, namely MongoDB. The data can be searched and retrieved via several means: <ul> <li>based form, by a SPARQL endpoint query, and by a RESTful API call. The system also enables the             the reconnection of MDCS repositories for faderated searches.</li> </ul> Carelyn Campbell, NIST             Ursula Kattner, NIST             Zachary Trautt, NIST             Zachary Trautt, NIST             Zachary Trautt, NIST             Zachary Trautt, NIST             Cate Brinson, Northwestern University             Raymundo Arroyave, Texas A&M University             Daniel J Sauceda, Texas A&M University             Baymundo Arroyave, Texas A&M University             Daniel J Sauceda, Texas A&M University             Baymundo Arroyave, Texas A&M University             Baymundo Arroy	Download Key Reports   External Stakeholders   Project Owners   MGI Projects by Category	
ESCRIPTION:       LEAD ORGANIZATION UNIT:         the NIST Materials Data Curation System (MDCS) provides a means for capturing, sharing, and transforming materials data to a structured format that is XML based amenable to transformation to other formats. The data are organized using user- solected templates encoded in XML Schema. These templates are used to create data entry forms. The documents are organized using user- aved in a non-relational (NoSQL) database, namely MongoDB. ## THE MOONS OF SATURN

Galileo no doubt planned to publish this new discovery in his next book, but in the meantime, how could he preserve his priority and prevent others from claiming the discovery as their own? His solution was to circulate an anagram, s m a i s m r m i l m e p o e t a l e u m i b u n e n u g t t a u i r a s. Others would know that he had discovered something and when he had discovered it, but they would not known what the discovery was. The number of letters in the anagram, 37, was too small to allow him later to fudge and change the solution to describe a discovery made by someone else in the meantime. Before the days of scientific papers (invented in the 1660s) this was an effective (if not always foolproof) method of claiming priority.

#### We need to both change the rules and give people tools to make that easier

http://galileo.rice.edu/sci/observations/saturn.html

# Addressing the real issue

## Until people can do science/engineering on these platforms it won't happen

- **Combine data sets**
- Build on prior work
- **Discover inter-relationships**
- Use AI/ML

# We need to create a National Materials Data Network

We need to have an ongoing conversation

We need to create a broad academic/ industrial/government community to drive the development of needed infrastructures

Funding

#### Must come from the community

# MaRDaC Materials Research Data Council

The Materials Research Data Alliance (MaRDa) is a newly formed organization focused on realizing the promise of open, accessible, and interoperable materials data. Each of these elements are aligned with the goals of the Materials Genome Initiative (MGI). MaRDa provides a platform that promotes the convergence of ideas, people, data, and tools to accelerate discovery, enable new insights into materials mechanisms, and lay the foundation for both human-centered and artificial intelligence-assisted approaches to materials design. MaRDa's governing council, MaRDaC, is an elected leadership body that promotes the interests of materials data researchers nationally and internationally and coordinates the efforts of MaRDa.

## Mission

**MGI 2.0 Preview** 

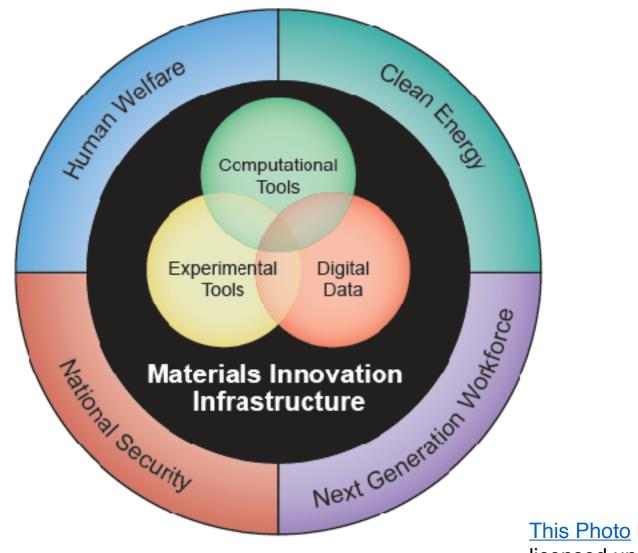

#### 2020 MATERIALS GENOME INITIATIVE STRATEGIC PLAN

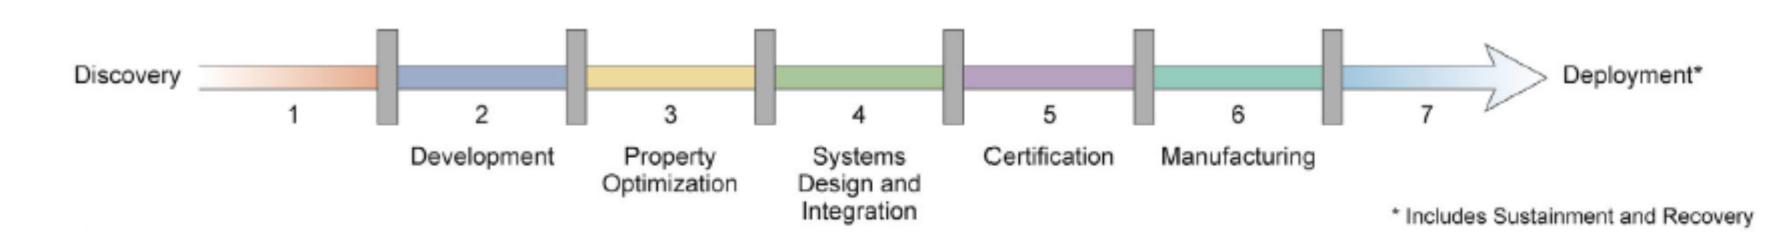

Materials Genome Initiative National Science and Technology Council Committee on Technology Subcommittee on the Materials Genome Initiative

DECEMBER 2014

## • Deploy the Materials Innovation Infrastructure (MII)

# ML and Autonomous Materials Science

**A. Gilad Kusne and Collaborators** 

# Phase Mapping: High-Throughput Approach (APL Materials 2016)

Fabricate hundreds-thousands of samples -> HiTp **Synthesis** 

**Measure all samples -> HiTp Characterization** 

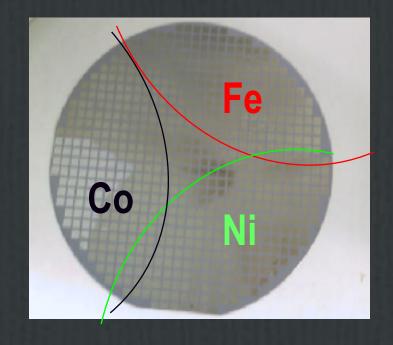

**Rapid phase mapping -> Machine Learning** 

Combi Library for Ternary Spread

 $C \cap$ 

XRD

Ni

#### Estimated Phase Map

# Phase Mapping: High-Throughput Approach

#### **Measurement is a time / resource sink**

□ For wafer of 500+ samples:

□ In Lab: Takes weeks-months

Synchrotron: Takes 5+ Hours (Every second counts)

Bruker D8 30 Minutes per sample 2 weeks!

Mn-Ni-Ge library 535 samples

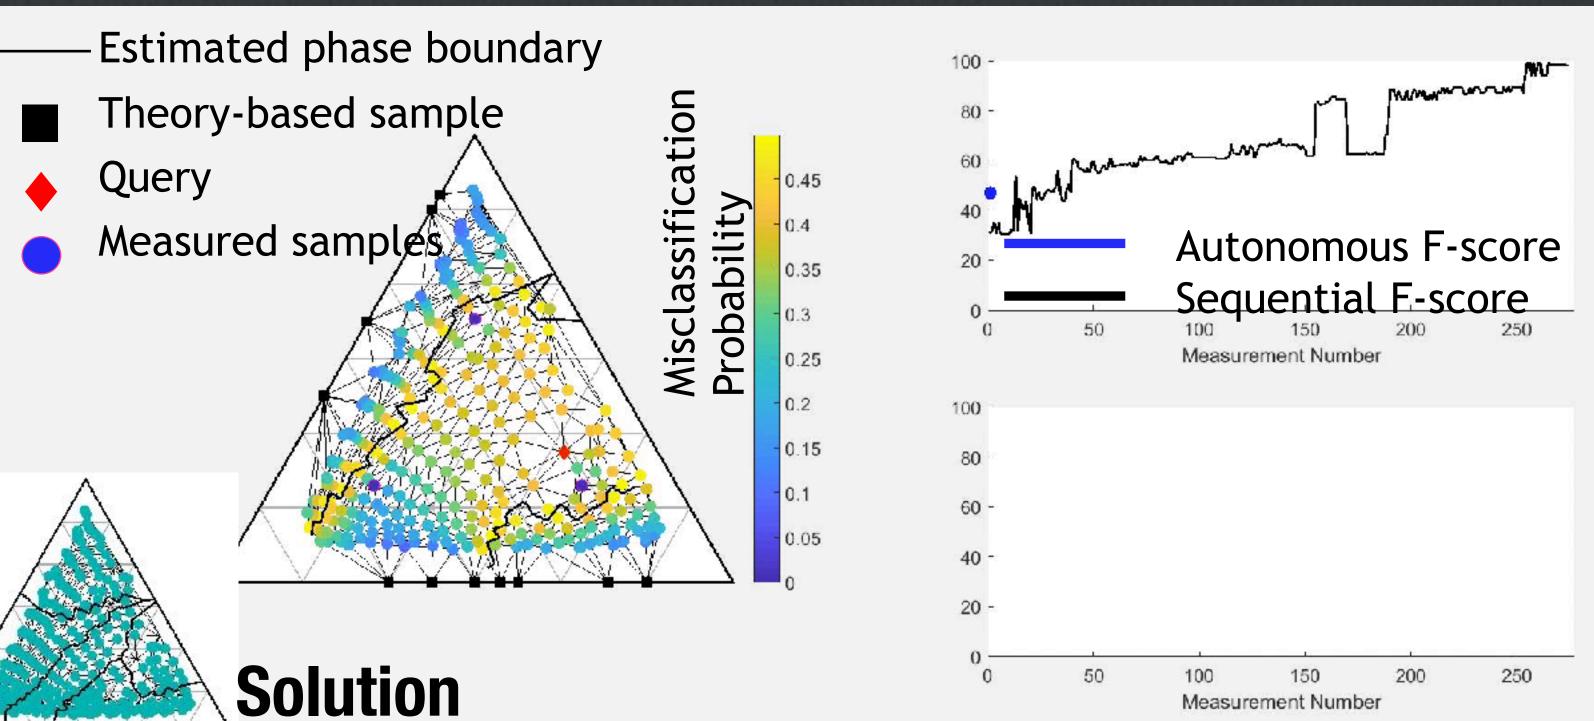

Stanford Synchrotron Radiation Lightsource 30 seconds per sample 4.5 hours

# Autonomous Phase Mapping

#### Why use AI to just analyze data? Put it on control of the equipment!

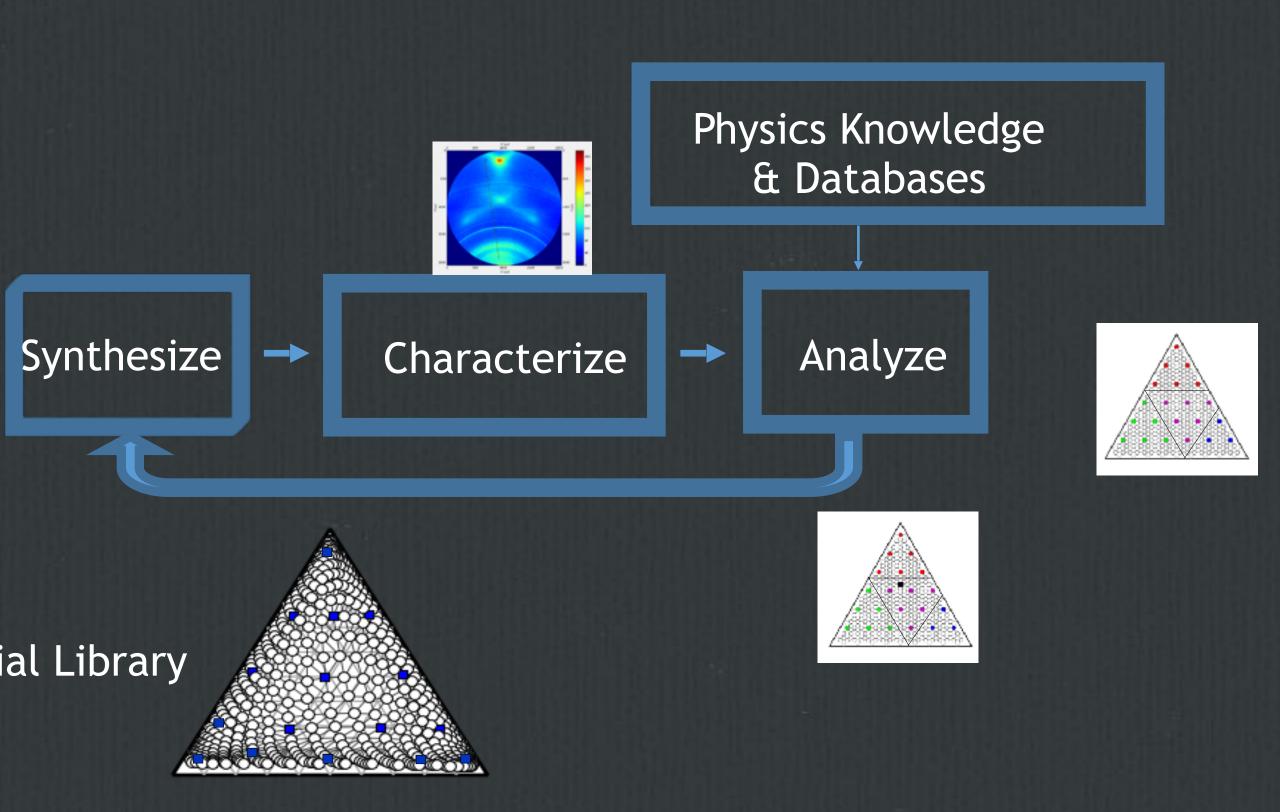

#### Al is controlling X-ray diffraction systems at SLAC & in the lab!

# □ Now: Place Al in control of Synthesis.

#### Test case: Combinatorial Library
